Introduction

Thank you for choosing to purchase the Selectronic LD250 TRUE SINE WAVE inverter. Many hours of Research and Development have gone into the LD250 to ensure this inverter provides you with many years of reliable service

Warranty Card

It is imperative that you complete your warranty card NOW. Your LD250 is covered by a TWO year warranty; this warranty is in addition to your rights under the trade practices act of your state or territory. Returning your completed warranty card will enable us to register your warranty and avoid any possible delays should service be required. If you have any comments about our product that will not fit on the warranty card please feel free to drop us a line. Yes, constructive criticism will also be welcome.

Installation

Please leave a clearance of 200mm on all sides and top of the Inverter. The LD250 must be installed in a dry, cool, dust-free environment. It is recommended that the inverter be placed as far from any radio receivers as possible.

Large amounts of DC current can be drawn by your LD250, *care must be taken.*

Fixed Installation

All fixed installation battery connections must be securely bolted, using stainless steel nuts and bolts. To protect the connection from corrosion smear a small amount of Vaseline or similar over the joint. Never place batteries directly onto a concrete floor, place timber or similar material beneath the batteries.

Warning

As a matter of safety, Selectronic strongly recommend that all fixed installations be designed and installed by appropriately qualified person. The Solar Energy Industries Association in your state or territory can provide names of accredited system designers and installers.

The output voltage from an inverter is as lethal as mains electricity.

All AC wiring **MUST** be carried out by an accredited electrician and must conform to AS3000 and/or any relevant local standards.

Electrician's Note

- All earth's AC and DC should be bonded
- RFI/Lightning Earth stake should be within 3m of the inverter
- The LD250 is suitable for connection to MEN wiring
- Any AC changeover switch must be a 'break before make' type

Portable Use

By using optional battery clips, the LD250 can be connected directly to a vehicle battery. When using Alligator clips ensure they have a tight grip around the battery post. Wherever possible battery connections should be bolted. If connecting the LD250 through a cigarette lighter socket the maximum power output of the LD250 will be *severely* restricted, this practice should be avoided. Check with your supplier or installer if you are unsure.

Do not use alligator clips in a moving vehicle

By incorporating an auxiliary battery in the manner above, the starting battery should remain charged for vehicle starting (see your auto electrician). The LD250 has sufficient battery cable length to allow it to sit underneath the vehicle whilst in use. If the ground is wet, place the LD250 on a waterproof liner.

Batteries and Connections

Batteries are the key to maximum performance from your LD250, if a battery is too small or not fully charged it may result in de-rated performance from your LD250.

Battery ratings

Batteries can be rated in one of two ways:

1. CCA = Cold Cranking Ability. This is the amount of power or current that a battery can deliver for a short period, typically a few seconds. This how a car battery would normally be rated.
2. Ah = Ampere Hours. This is the maximum amount of energy that can be stored in a battery; this figure will generally be stated at a particular hour rate. This is how a deep cycle or storage battery would normally be rated.

100Ah @100hr, this means that when this battery is discharged over a period of 100 hours, the battery has a capacity of 100Ah. This in theory means 1 Amp for 100 hours, although this would in practice result in a totally discharged battery that may not then recover.

To achieve maximum performance from your LD250 you must have a battery capable of delivering 25 Amps for a short period whilst maintaining at least 21.0 volts. To increase the capacity of your battery you may need to join more than one battery together.

- Where batteries are joined in *series*, add the voltage of each battery.

The capacity will equal the capacity of the smallest battery. 2 x 12 Volt 100 Ah batteries connected in series would have a total capacity of 24 Volts – 100 Ah.

- Where batteries are joined in **parallel**, add the capacities together, the voltage will remain the same as each batteries voltage.

2 x 12 Volt 100 Ah battery capacity of 12 Volts – 200 Ah. This would not suit your 24 Volt LD250.

Only use identical batteries when joining batteries together.

How long will my battery last

To work out how long your battery will last follow this basic guide.

This guide presumes commencing with a fully charged battery.

Take the total rating of the appliance being run

1	light globe	25watts
1	20 inch TV	67watts
1	VCR	30watts

Total load =122watts

Divide this figure (122) by 20 to know the approximate DC current draw
=6.1Amps

To convert this to Ampere hours, multiply by the number of hours used -
Say 1 hour =6.1Ah

So if we have a 50Ah battery, then with the above example we should have 50 minus 6.1 = 43.9 Ah remaining in the battery.

As a general guide never discharge a battery below 50%. The deeper a battery is discharged on a regular basis, the less life you can expect from the battery. See your battery specifications for full details.

Getting Started Quickly

If you want to get powered up quickly here are the 10 simple steps.

1. Familiarise yourself with the details in the first 6 pages on this manual.
2. Unpack the LD250 from the packaging.
3. Check unit for any damage that may have resulted during transport, if any damage is evident report this to your supplier immediately.
4. Make sure the LD250 ON/OFF switch (8) is in the off position.
5. Connect battery positive wire (red) (6) to battery positive or battery fuse.
6. Connect battery neg. wire (black) (7) to battery negative or battery fuse.
7. Plug a 230 - 240V appliance into inverter front power point (4) but do not switch on.
8. Turn ON/OFF switch (8) to ON.
9. LED (1) will illuminate. If no LEDs light, check for correct connection to battery.
10. You're away.

LD250 Parts Identification

Positive (Red) Battery lead (6) can be viewed from the rear.
Negative (Black) Battery Lead (7) can be viewed from the rear.

Operation

Three LEDs are provided on the front panel to indicate the operating Status of the LD250 Inverter.

STATUS indicator LED's

LED 1, "ON". Indicates that the inverter is supplying power to the load.

LED 2, DC Volts Low / DC Volts High.

"Flashing" If the inverter shuts down due to low battery voltage (the battery is flat) then LED 2 will flash. Charge the battery by starting the vehicle or use a battery charger. When the battery is charged the battery voltage will rise, LED 2 will turn OFF and the inverter re-activate.

"Permanently ON" If the inverter shuts down due to high battery voltage then LED 2 will stay ON. When the battery voltage is reduced LED 2 will turn OFF and the inverter re-activate.

LED 3, Over temperature / AC Overload.

"Permanently ON" If the inverter shuts down due to internal components getting too hot, then LED 3 will come ON and will remain ON until the temperature has dropped to a safe level. LED 3 will then turn OFF and the inverter re-activate.

- If LED 3 is coming ON regularly, either reduce the amount of load on the inverter or, if possible, move the inverter to a cooler location.

"Flashing" If the inverter shuts down due to too much AC load being drawn from it then LED 3 will FLASH. The inverter will remain in this condition for 1 minute after the AC load has been decreased to a safe level.

- If the inverter remains in this overload condition beyond one minute, switch 8 (ON /OFF Switch) should be turned OFF and then back ON to re-activate the inverter.

Maintenance

Inverter

Periodic maintenance of your LD250 inverter involves little more than checking for any obstructions to the black cooling heatsink at the rear of the inverter. The heatsink must be cleared of any accumulated foreign matter that may have lodged itself between the fins since the last maintenance check, e.g. insect nests. Also verify that airflow around the inverter has not become restricted.

Batteries

1. Every week, carry out a thorough visual inspection of all battery wiring, taking particular note of the condition of inter-connections between cells. This maintenance should be carried out in conjunction with the battery manufacturers recommended maintenance.

Safety Hint

When working on batteries of such high capacity it is essential that you wear protective clothing, some form of eye protection and rubber-soled work boots. Please regard your batteries with a great deal of caution, and if in any doubt, entrust this work to your supplier / installer.

2. Check that the stainless steel inter-connecting bolts are tight and have no corrosion. If corrosion is evident, carefully follow the following procedure.
 - Disconnect the system battery fuse before working on the battery bank.
 - Unbolt the stainless steel bolts and nuts of any corroded connections and thoroughly clean the joint with a wire brush or file, taking extreme care not to short circuit any battery cells with any tools.
 - Re-assemble and smear a small amount of Vaseline or similar grease over the surface of the joint to slow down any future corrosion.
3. Once a fortnight or as directed in your battery manufacturer, check the specific gravity (SG) of each battery cell using a hydrometer, to ensure

that all cells are performing correctly and are properly charged. Any serious imbalance should be reported to your system designer in case remedial action needs to be taken.

Radio Frequency Interference

Radio Frequency Interference (RFI) can be a problem for owners of inverters. RFI in a domestic situation may produce noise or interference on a radio or TV receiver.

Considerable development time has resulted in a reduction of the RFI generated by the inverter to a level that complies with C-tick requirements. Compliance to this standard means RFI is low, but how well the inverter performs in a particular installation can vary. Below are some suggestions to help reduce the effects of RFI in your installation;

- It is recommended that the power system including the inverter be housed at least 15 metres from the home.
- Ensure an earth stake is placed as close to the inverter as possible and connected to the inverter via a short length of wire. See page 2 for wiring details.
- Avoid running DC cables into the home, if at all possible. If this cannot be avoided, run DC and AC in separate conduits separated by as much distance as practicable. All DC wiring should also be kept together and be as short as possible.
- If your inverter is to be installed in a mobile home or similar, try to keep your inverter at least one metre away from your radio or audio equipment. The further the better.

Fault Finding

No indicators ON when power is first applied

When first connected, if the LD250 shows no indicators the battery connections may be reversed. Check that the red battery wire (6) is connected to the battery positive, and the black battery wire (7) is connected to the battery negative.

Inverter shuts down during the middle of the day, and comes back ON late in the afternoon

This is more than likely caused by high battery volts during peak charging times from Solar Panels. Battery volts should never exceed 34 volts. If this is the case, have your Solar Regulator checked.

Warranty

Selectronic Australia Pty Ltd warrants your inverter to be free from

Unauthorised modification or repair will void your warranty.

The inverter must be returned, at the owner's cost, to an authorised service centre listed in this manual. There will be no charge for the return of the inverter.

Outside Australia & New Zealand

Inverter Type Microprocessor control circuit with PWM full bridge power stage. True sine wave AC output

Current draw from Battery	
Condition	Amperage
Inverter ON, with no Load	0.42 Amps
Maximum Continuous Load (240 Watt)	12.0 Amps
Surge rating (700 Watt)	35 Amps

Inverter Power Ratings @ 25° C		
Condition	Total Inverter output	
	Wattage @ 1.0pf	Current
Continuous	250 Watt	1.04 Amps
Half hour rating	320 Watt	1.3 Amps
Surge rating (3 seconds)	750 Watt	2.8 Amps

Battery Voltage Range	Voltage
Low DC Volts Cut Out–10 second delay	22 volts
Low DC Volts Cut In	24 volts
High DC Volts Cut Out–Instantaneous	34 volts

Miscellaneous Specifications	
Reverse Polarity Protection	Full Electronic Protection
Output Voltage Accuracy 0-350 watts	± 4% @ 12 volt input
Output Frequency	50Hz ± 0.01%
Total Harmonic Distortion	<4%
Operating Temperature Range	-10° C to 50° C
Socket Outlet	10 Amp Single Pole
Chassis	Powder Coated Zinc Steel
